The oligonucleotide was used to specifically hybridise with HBV in a targettable, soluble DNA soln., to form a stable complex in soln. See also AAQ38442. (Updated on 25-MAR-2003 to correct PN field.)

bearing cells useful for inhibiting viral and oncoprotein RNA expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a human hepatitis B antisense oligonucleotide which can be used as a component of the soluble molecular complex of the invention. The invention relates to a soluble molecular complex comprising a single stranded antisense oligonucleotide which hybridises to an RNA in a target cell. The antisense oligonucleotide is complexed with a carrier comprised of a ligand for the asialoglycoprotein receptor and a polycation. The molecular complex has cytostatic, virucide, hepatotrophic and anti-inflammatory activity. The complex works through cell specific antisense inhibition of RNA expression. The molecular complex is used for inhibiting oncogene and viral (especially hepatitis)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RNA expression in asialoglycoprotein receptor-bearing cells. The present sequence is a probe which was used in an example demonstrating disease symptoms induced in a small animal model, Tupaia demonstrating disease symptoms induced in a small animal model, Tupaia belangeri, after infection by Hepatitis B virus (HBN). This example is provided in a specification relating to the use of native or non-native antigen or antigens, or their immunological equivalent, for preparing a pharmaceutical composition for use in transplantation processes, for treating or preventing undesirable immunological consequences of vaccination or immunisation in a subject, or for treating immune-related disorders. The invention provide unique selective immune down regulation processes. They may be used for preventing or treating graft versus host rejection and for treating crown's disease, primary sclerosing cholangitis disease, primary sclerosing cholangitis disease, primary biliary cirrhosis disease, primary Celliac's disease, primary autoimmune chronic active hepatitis, chronic liver rejection disease, immune-mediated liver fibrosis disease, immune-mediated vascular disorder, and immune-mediated muscle disorders affecting smooth muscle, striated muscle and blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The invention relates to a novel homogeneous conjugate comprising a hepatic ligand, bifunctional linker and biologically stable oligomer that binds to a sequence in a hepatic virus or pathogen and is released from the conjugate by hydrolysis or reduction. The conjugate of the invention may be useful during the treatment of liver diseases including chronic viral hepaticis, cirrhosis, malaria, viral protozoan infection and cancer, such as hepatocellular carcinoma (HCC). The current sequence is that of the A-L-P conjugate-related RNA oligomer 3 of the invention.
                                                                           homogeneous A-L-P conjugate, hepatic; chronic viral hepatitis; cirrhosis; malaria; viral infection; protozoan; cancer; hepatocellular carcinoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New homogeneous prodrug conjugate containing hepatic ligand for delivery of pathogen-specific oligomer useful for treating liver infections or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      hepatic ligand, bifunctional linker and biologically stable oligomer that binds to a sequence in a hepatic virus or pathogen and is released from the conjugate by hydrolysis or reduction. The conjugate of the invention may be useful during the treatment of liver diseases including chronic viral hepatitis, cirrhosis, malaria, viral or protozoan infection and cancer, such as hepatocallular carcinoma (HCC). The current sequence is that of the NG2 A-L-P conjugate DNA component of the invention which was used to target the Hepatitis B virus (HBV) c (core)-gene.
                                                    homogeneous A-L-P conjugate; hepatic; chronic viral hepatitis; cirrhosis; malaria; viral infection; protozoan; cancer; hepatocellular carcinoma; HCC; ss; NG2; HBV; c-gene; core.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New homogeneous prodrug conjugate containing hepatic ligand for delivery of pathogen-specific oligomer useful for treating liver infections or cancer.
                                                                                                                                                                                                                                                                                                                                              /note= "OTHER = Optionally linked to YEE(ahGalNAc)3-SMCC and various chemical groups as shown in figures"

This comprises transmucosal administration of composition comprising an epitope which is located in close proximity to the immune response. The process may be used in treatment of mammals which are acutely or chronically infected with infectious agents, such as viruses or bacteria. It may be used to increase the immune response, or infectious agent itself exhibite limited pathogenicity but the immune response to the infectious agent causes more significant pathogenicity. This can be the case in, e.g. hepatitis B virus (HBV) infection. The
                                                                                                           This primer designated MF03 covers nucleotide bases 1903-1949 at the beginning of the hepatitis B virus (HBV) core open reading frame. It is used with MF04 (AAQ80500) to amplify the core gene. The primers allow the detection of a specific class of HBV variants. They are useful for demonstrating the presence of productive virus infection and may prove useful in monitoring therapeutics. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modulating immune responses in mammals infected with infectious agent(s) - e.g. to reduce pathogenicity caused by immune responses in cases where the infectious agent has limited pathogenicity.

The present sequence is a PCR primer used to detect a transgene in severe combined immunodeficient (SCID) mice. Transgenic immunodeficient mice were produced that are not tolerant to hepatitis viral antigens, lack functional T-cells and contain integrated hepatitis virus blain the somatic and germ cells. The hepatitis virus gene is expressed and the hepatitis virus is replicated in the transgenic mouse. The mouse may be used as an animal model for evaluating interactions of a chemical, drug or immunomodulating agent with a hepatitis virus. It is also useful for the assessment of anti-viral and immunomodulatory intervention therapies, including the screening of drug candidates. It can be used to analyse the virus and chemicals metabolised and/or detoxified by the liver, and to identify cellular biochemical pathways contributing to the development
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Transgenic mouse useful in methods for evaluating interactions of chemical, drug or immunomodulating agent with hepatitis virus, lacks functional T-cells and B-cells and is capable of replicating hepatitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          mouse is thus

The invention relates to a method of predicting the long term response of a host of hepatitis B virus (HBV) to 3TC therapy by determining whether the HBMS (1) bears a nucleic acid that encodes for a leucine at amino acid position (aa) 91 in the DNA polymerase region of HBW. The method comprises

(originally codon 438) or a (ii) a cysteine at aa256 (originally codon 604) in the DNA polymerase region of HBW. The method comprises

determining whether the HBV carried by the host bears one or more of the following mutations: (i) Q213S (glutamine to serine at aa213) (originally codon 604) in the HBW polymerase region, (ii) G139T, A1752C/T, T1909C, T1960G, or T1961A/G specific point mutation in the DNA precore/core promoter or open reading frame (ORF) region or (iii) a pair of nucleotide promoter or open reading frame (ORF) region or (iii) a pair of nucleotide and C1962A representing specific double point mutations in the DNA precore/core promoter or ORF region. The method and kit is useful in predicting the long-term response of a host of HBV to 3TC therapy (also known as lamivudine). This sequence represents an oligonucleotide sequence used in the method of the invention to detect a mutation in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Predicting the long-term response of a host of hepatitis B virus (HBV) to 3TC therapy comprises determining whether the HBV bears a nucleic acid encoding leucine at amino acid position (aa) 91 or cysteine at aa256.
                                                                                                                                                                                                                                             Probe #151 to determine effect of long term lamivudine treatment of HBV.

The invention relates to a method of predicting the long term response of a host of hepatitis B virus (HBV) to 3TC therapy by determining whether the HBV carried by the host (i) bears a nucleic acid that encodes for a leucine at amino acid position (as) 91 in the DNA polymerase region (as) 10 in the DNA polymerase region of HBV. The method comprises determining whether the HBV carried by the host bears one or more of the collowing mutations: (i) Q213S (glutamine to serine at aa213) (originally codon 604) in the HBV polymerase region, (ii) G1339T, A1752CT, T1909C, T1960G, or T1961A/G specific point mutation in the DNA precore/core promoter or open reading frame (ORF) region or (iii) a pair of nucleotide and C1962A representing specific double point mutations in the DNA precore/core promoter or ORF region. The method and kit is useful in predicting the long-cerm response of a host of HBV to 3TC therapy (also known as lamivudine). This sequence represents an oligonucleotide calculation in the method of the invention to detect a mutation in the

Predicting the long-term response of a host of hepatitis B virus (HBV) to 3TC therapy comprises determining whether the HBV bears a nucleic acid encoding leucine at amino acid position (aa) 91 or cysteine at aa256.

Claim 31; SEQ ID NO 154; 107pp; English.

The invention relates to a method of predicting the long term response of a host of hepatitis B virus (HBV) to 3TC therapy by determining whether the HBV carried by the host (i) bears a nucleic acid that encodes for a leucine at amino acid position (aa) 91 in the DNA polymerase region (coriginally codon 438) or a (ii) a cysteine at aa256 (originally codon 644) in the DNA polymerase region of HBV. The method comprises of the codon 604) in the HBV polymerase region, (ii) G1739T, A1752C/T, T1909C, T1960G, or T1961A/G specific point mutation in the DNA precore/core promoter or open reading frame (ORF) and A1752G, T1909G and A1911T or T1961A and C1962A representing specific double point mutations in the DNA precore/core promoter or ORF region. The method and kit is useful in precore/core promoter or ORF region. The method and kit is useful in predicting the long-term response of a host of HBV to 3TC therapy (also known as lamivudine). This sequence represents an oligonucleotide sequence used in the method of the invention to detect a mutation in the above mentioned sequences.

Zuechtungsforschung, Carl-von-Linne-Weg 10, Koeln, 50829, Germany This sequence has been recovered from the left border of the T-DNA. It indicates an insertion within the locus defined by BAC clone P5912. Details on the protocols used for generation of the sequence are described in References 1-3. The sequences are generated at the MPI for Plant Breeding Research in the context of the GABI-Kat project. GABI-Kat is part of the Garman Plant Genomics program designated 'GABI'. Information on line availability can be found at: http://www.mpiz-koeln.mgg.de/GABI-Rat/.

The lines contain one or more T-DNA insertions. The DNA fragment(s) resulting from the PCR were directly sequenced to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed."

/note="Vector: pBluescript SK-; Site 1: ECORI; Site 2:
Xho1; CDNA was prepared from 2ug of poly A+ RNA (equal parts from stage 10.5 and stage 11.5 gastrulae).
ECORI-XhoI cut CDNA was then ligated into Unizap-XR (Stratagene) with ECORI at the 5' end and XhoI at the 3' end. SS-library phagemids were prepared by mass excision from the original library and normalized by hybridization to bictinylated driver (prepared from the same library by PCR) to Cot-omega of 11. After removal of hybrids and excess driver by streptavidin sepharose chromatography, the ss-phagemids were made double stranded and electroporated into Top-10 F'. Original library contruction by Bruce Blumberg (Cho et al. 1991 Cell 67, 1111-1120). Normalized by Jihwan Song (Song, Cho and Blumberg, unpublished). Note: This is a Xenopus Gene Collection (XGC) library."

Mills JS;

```
The present sequence represents a synthetic oligonucleotide HBV93Mb which is complementary to a portion of the hepstilis B virus (HBN) RM. The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides containing a sequence which is complementary to at least two non-contiguous regions of an HBV nucleic acid, may be used for inhibiting HBV replication in a cell or for the treatment of HBV infection

The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides containing a sequence which is complementary to at least two non-contiguous regions of an HBV nucleic acid, may be used for inhibiting HBV replication in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oligo:nucleotide(s) complementary to hepatitis B virus (HBV) sequences used in the detection and treatment of HBV infection.

It is used with MF04 (AAQ080500) to amplify the core gene. The primers allow the detection of a specific class of HBV variants. They are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         demonstrating the presence of productive virus infection and may prove useful in monitoring therapeutics. The primers AAV45201 and AAV45202 were used to detect the presence of a HBV genome which had been microinjected into embryos of SCID mice in an example to demonstrate modulating an immune response in a mammal infected with an infectious agent. This comprises transmucosal administration of a composition comprising an epitope which is located in close proximity to the immune response. The process may be used in treatment of mammals which are acutely or chronically infected with infectious agents, such as viruses or bacteria. It may be used to increase the immune response, or it may be used to decrease the immune response in cases where the infectious agent itself exhibits limited pathogenicity but the immune response to the infectious agent causes more significant pathogenicity. This can be the case in, e.g. hepatitis B virus (HBV) infection. The process can modulate undesirable autoimmune responses exhibited by mammals infected with viral, bacterial and parasitic agents. It can prevent life-long disabilities which result from these infections
                                                                                                                                                                                                                                                                                                                                    Modulating immune responses in mammals infected with infectious agent(s) - e.g. to reduce pathogenicity caused by immune responses in cases where the infectious agent has limited pathogenicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

combined immunodeficient (SCID) mice. Transgenic immunodeficient mice were produced that are not tolerant to hepatitis viral antigens, lack functional T-cells and B-cells and contain integrated hepatitis virus latter in the somatic and germ cells. The hepatitis virus gene is expressed and the hepatitis virus is replicated in the transgenic mouse. The mouse may be used as an animal model for evaluating interactions of a chemical, drug or immunomodulating agent with a hepatitis virus. It is also useful the assessment of anti-viral and immunomodulatory intervention therapies, including the screening of drug candidates. It can be used to analyse the virus and chemicals metabolised and/or decoxified by the liver, and to identify cellular biochemical pathways contributing to the development and progression of chronic liver disease. The transgenic mouse is thus useful for elucidating the effects of hepatitis virus on hepatic

Predicting the long-term response of a host of hepatitis B virus (HBV) 3TC therapy comprises determining whether the HBV bears a nucleic acid

t C

leucine at amino acid position (as) 91 in the DNA polymerase region (criginally codon 438) or a (ii) a cysteine at aa256 (originally codon 604) in the DNA polymerase region of HBV. The method comprises determining whether the HBV carried by the host bears one or more of the following mutations: (i) Q2138 (glutamine to serine at aa213) (originally codon 604) in the HBV polymerase region, (ii) G1739T, A1752C/T, T1909C, T1960A, or T1961A/G specific point mutation in the DNA precore/core promoter or open reading frame (ORF) region or (iii) a pair of nucleotide changes A1738C and G1739T, A1750G and A1752G, T1909G and A191T or T1961A and G1962A representing specific double point mutations in the DNA precore/core promoter or ORF region. The method and kit is useful in predicting the long-term response of a host of HBV to 3TC therapy (also known as lamivudine). This sequence represents an oligonucleotide sequence used in the method of the invention to detect a mutation in the The invention relates to a method of predicting the long term response ca host of hepatitis B virus (HBV) to 3TC therapy by determining whether the HBV carried by the host (i) bears a nucleic acid that encodes for a encoding leucine at amino acid position (aa) 91 or cysteine at aa256 Claim 31; SEQ ID NO 155; 107pp; English above mentioned sequences.

Predicting the long-term response of a host of hepatitis B virus (HBV) to 3TC therapy comprises determining whether the HBV bears a nucleic acid encoding leucine at amino acid position (aa) 91 or cysteine at aa256.

Claim 31; SEQ ID NO 154; 107pp; English.

The invention relates to a method of predicting the long term response of a host of hepatitis B virus (HBV) to 3TC therapy by determining whether the HBV carried by the host (i) beass a nucleic acid that encodes for a leucine at amino acid position (as) 91 in the DNA polymerase region (originally codon 438) or a (ii) a cysteine at aa256 (originally codon 604) in the DNA polymerase region of HBV. The method comprises determining whether the HBV carried by the host bears one or more of the following mutations: (i) Q2135 (glutamine to serine at aa213) (originally codon 604) in the HBV polymerase region, (ii) G1739T, A172c/T, T1909C, T1960G, or T1961A/G specific point mutation in the DNA precore/core promoter or open reading frame (ORF) region or (iii) a pair of nucleotide changes A1738C and G1739T, A175C, T1909C and G173PT, A175C, T1909C and G175C, T1905C and A175CG and A175CC and A175C

S Predicting the long-term response of a host of hepatitis B virus (HBV) 3TC therapy comprises determining whether the HBV bears a nucleic acid encoding leucine at amino acid position (aa) 91 or cysteine at aa256.

Claim 31; SEQ ID NO 156; 107pp; English

The invention relates to a method of predicting the long term response of a host of hepatitis B virus (HBV) to 3TC therapy by determining whether the HBV carried by the host (i) bears a nucleic acid that encodes for a leucine at amino acid position (as) 91 in the DNA polymerse region (criginally codon 438) or a (ii) a cysteine at aa256 (originally codon 604) in the DNA polymerse region of HBV. The method comprises equion of the cermining whether the HBV carried by the host bears one or more of the following mutations: (i) Q2135 (glutamine to serine at aa213) (originally codon 604) in the HBV polymerse region, (ii) G17397, A1752C/T, T1999C, T1960G, or T1961AG specific point mutation in the DNA precore/core promoter or open reading frame (ORF) region or (iii) a pair of nucleotide changes A1738C and G13397, A1750G and A1752C, T199G and A1911T or T1961A precore/core promoter or ORF region. The method and kit is useful in precore/core promoter or ORF region. The method and kit is useful in sequence used in the method of the invention to detect a mutation in the above mentioned sequences.

Claim 31; SEQ ID NO 158; 107pp; English

```
The invention relates to a method of predicting the long term response of
a host of hepatitis B virus (HBV) to 3TC therapy by determining whether
the HBV carried by the host (i) bears a nucleic acid that encodes for a
leucine at amino acid position (aa) 91 in the DNA polymerase region
(originally codon 438) or a (ii) a cysteine at aa256 (originally codon
(originally codon 438) or a (ii) a cysteine at aa256 (originally codon
(originally codon 438) or a (ii) a cysteine at aa256 (originally codon
(originally codon 438) or a (ii) a cysteine at aa213) (originally
determining whether the HBV carried by the host bears one or more of the
following mutations: (i) Q2138 (glutamine to serine at aa213) (originally
codon 604) in the HBV polymerase region, (ii) G17397, A1732C/T, T1909C,
T1960G, or T1961A/G specific point mutation in the DNA precore/core
promoter or open reading frame (ORP) region or (iii) a pair of nucleotide
changes A138C and G1739T, A175CG and A1752G, T1909G and A1911T or T1961A

or and C1962A representing specific double point mutations in the DNA
precore/core promoter or ORF region. The method and kit is useful in
predicting the long-term response of a host of HBV to 3TC therapy (also
known as lamivudine). This sequence represents an oligonucleotide
chown as lamivudine). This sequence represents an oligonucleotide
conduction of the invention to detect a mutation in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           원
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of predicting the long term response of a host of hepatitis B virus (HBV) to 3TC therapy by determining whether the HBV carried by the host (i) bears a nucleic acid that encodes for a leucine at amino acid position (aa) 91 in the DNA polymerase region (originally codon 438) or a (ii) a cysteine at aa256 (originally codon 644) in the DNA polymerase region of HBV. The method comprises determining whether the HBV carried by the host bears one or more of the following mutations: (i) 02135 (glutamine to serine at aa213) (originally codon 604) in the HBV polymerase region, (ii) G1739T, A1752C/T, T1909C, T1960G, or T1961A/G specific point mutation in the DNA precore/core promoter or open reading frame (ORF) region or (iii) a pair of nucleotide changes A1738C and G1739T, A1750G and A1752G, T1909G and A1911T or T1961A and C1962A representing specific double point mutations in the DNA precore/core promoter or ORF region. The method and Nit is useful in predicting the long-term response or a host of HBV to 3TC therapy (also known as lamivudine). This sequence represents an oligonucleotide become of a nethod of the invention to detect a mutation in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                   Predicting the long-term response of a host of hepatitis B virus (HBV) to 3TC therapy comprises determining whether the HBV bears a nucleic acid encoding leucine at amino acid position (aa) 91 or cysteine at aa256.

The invention relates to a method of predicting the long term response of a host of hepatitis B virus (HBV) to 3TC therapy by determining whether the HBV carried by the host (i) bears a nucleic acid that encodes for a leucine at amino acid position (as) 91 in the DNA polymerase region (originally codon 438) or a (ii) a cysteine at aa256 (originally codon 604) in the DNA polymerase region of HBV. The method comprises cederamining whether the HBV carried by the host bears one or more of the following mutations: (i) 02133 (glutamine to serine at aa213) (originally codon 604) in the HBV polymerase region, (ii) 61739T, A1752C/T, T1909C, T1960G, or T1961A/G specific point mutation in the DNA precore/core promoter or open reading frame (ORF) region or (iii) a pair of nucleotide changes A1738C and G1739T, A1750G and A1752G, T1909G and A1911T or T1961A and C1962A representing specific double point mutations in the DNA compore or ORF region. The method and kit is useful in precore/core promoter or ORF region. The method and kit is useful in the method of the invention to detect a mutation in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 15
```

3TC therapy comprises determining whether the HBV bears a nucleic acid encoding leucine at amino acid position (aa) 91 or cysteine at aa256.

Claim 31; SEQ ID NO 160; 107pp; English.

The invention relates to a method of predicting the long term response of a host of hepatitis B virus (HBV) to 3TC therapy by determining whether the HBV carried by the host (i) bears a nucleic acid that encodes for a leucine at amino acid position (as) 91 in the DNA polymerase region (criginally codon 438) or a (ii) a cysteine at aa256 (originally codon 604) in the DNA polymerase region of HBV. The method comprises determining whether the HBV carried by the host bears one or more of the collowing mutations: (i) Q2135 (glutamine to serine at aa213) (originally codon 604) in the HBV polymerase region, (ii) G1397, A1752CT, T1909C, T1960G, or T1961A/G specific point mutation in the DNA precore/core promoter or open reading frame (ORF) region or (iii) a pair of nucleotide changes A1738C and G1739T, A1750G and A1752G, T1909G and A1911T or T1961A and C1962A representing specific double point mutations in the DNA precore/core promoter or ORF region. The method and kit is useful in predicting the long-term response of a hose of HBV to 3TC therapy (also known as lamivudine). This sequence represents an oligonucleotide sequence used in the method of the invention to detect a mutation in the above mentioned sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              EST 01-MAR-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /clone_lib="HK"
/note="Vector: pBluescript SK+; Site_1: EcoRI (5'-end of cDNA); Site_2: XhoI (3'-end of cDNA); Due to a cloning artefact caused by the kit, in most cases the EcoRI site is NOT present, as well as the EcoRIadapter used for cloning. To excise the insert, restriction sites upstream EcoRI should be used (e.g. BamHI, SalI,PetI). NOTE: Also due to the cloning system used Blue/white selection for recombinats is not 100% reliable."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              693 bp mRNA linear EST 01-MAR-2

This GSS is part of a random genomic sequencing program of thirteen
yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces
exiguus, Saccharomyces servazzii, Zygosaccharomyces rouxii,
Saccharomyces kluyveromyces marxianus var. marxianus, Pichia
angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila,
Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to
5 kb were prepared and both extremities were sequenced. See
keywords for description of this sequence and for the sequence of
the other extremity of this insert.

This GSS is part of a random genomic sequencing program of thirteen
yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces
exiguus, Saccharomyces servazzii, Zygosaccharomyces rouxii,
Saccharomyces kluyveromyces thermotolerans, Kluyveromyces
lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia
angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila,
Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to
5 kb were prepared and both extremities were sequenced. See
keywords for description of this sequence and for the sequence of
the other extremity of this insert.

This GSS is part of a random genomic sequencing program of thirteen
yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces
exiguus, Saccharomyces servazzii, Zygosaccharomyces rouxii,
Saccharomyces Rluyveri, Kluyveromyces thermotolerans, Kluyveromyces
lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia
angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila,
Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to
keywords for description of this sequence and for the sequence of
the other extremity of this insert.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note="similar to Saccharomyces cerevisiae ORF YHR172w [

The primary library was mass excised as phagemid using the ExAssist helper phage (Stratagene). Clones were mass excised using the ExAssist helper phage (Stratagene), the phagemids were precitptated with PEG 8000 and extracted with phenol/chloroform. Phagemid DNA was electroporated into DH10B cells. Clone Availability: David Sibley, Washington University."
